

Anexo I

Grupo I

Foi ajustada a regressão linear múltipla do peso vivo (variável **Peso**, em kg) sobre as restantes variáveis observadas (idade (em dias), altura (variável **Alt**, em cm), perímetro torácico (variável **PT**, em cm) e do perímetro da canela (variável **PCAN**, em cm). Eis os resultados obtidos com o ajustamento deste modelo:

```
proc reg data=cavalos plots=diagnostics;
model Peso = Idade Alt PT PCAN /clb covb xpx R CLI CLM R P ;
output out=diagnostics r=r student=int_r rstudent=ext_r h=leverage cookd=cooksdi
p=predicted;
RUN;
proc print data=diagnostics;
run;
```
