

## INCOR

THE HIGH  
METROPOLIS A

What if the industrialisation of agriculture were logically led by the metropolis? Such is the belief of those who, confronting the consequences of industrialised agriculture, see the poison, and that only a form of concentration and control may hold it in check. Glasshouses, vertical farms, the breakthrough and disruption of hydroponics and closed-systems liberate their vast outlying areas into biological reactors or factories which turn synanthropic plants into the metropolitan Noah's Ark.

In this perspective, much emblematic (in hybrid linguistics), the metropolis is just as the *manifest destiny* condition of our whole biosphere as a control tower surveying the world of robotised *latifundias*, into forests, mines, natural preserves scientifically managed by agriculture. Concentration is well expressed in *Discipline* (2008): "One emerging element should be concentrated in good. Concentrating energy in casks is an improvement over the extraction of energy from spent coal and oil in the area of food and fibre into high-yield agriculture. Vertical farming and aquaculture frees up more water for their expert Gaian tasks."
