# FOREST MANAGEMENT AND CERTIFICATION 

## Practice problem set 2

1. If you invest $2200 €$ in a stock that grows at $11 \%$ percent annually, how much would it be worth in 22 years?
2. If you expect a timber harvest to yield $10000 €$ in 25 years, and your minimum acceptable rate of return is $7 \%$, what is this harvest worth to you today?
3. Using a $6 \%$ discount rate, what is the present value of 15 annual hunting lease revenues of $200 €$ each, the first due in one year?
4. At $8 \%$ interest, what is the present value of annual tax payments of $10 €$, beginning in one year and continuing in perpetuity?
5. In the previous question, what would be the present value be if the annual tax payments didn't start until 4 years from now?
6. Answer question 4 making the first tax payment now
7. Assume the following expected incomes and costs from an hectare of bare forestland:

| $\mathbf{1 2 5 €}$ | Initial reforestation cost today |
| :--- | :--- |
| $\mathbf{5 0 €}$ | Brush control cost in 5 years and every 5 thereafter |
| $\mathbf{7 5 €}$ | Thinning cost in 10 years and every 10 thereafter |
| $\mathbf{2 €}$ | Annual taxes in perpetuity, starting in one year |
| $\mathbf{1 . 2 5 €}$ | Annual hunting revenues in perpetuity, starting in one year |
| $\mathbf{2 0 0 €}$ | Pulpwood thinning revenue in 20 years |
| $\mathbf{3 0 0 0 €}$ | Final harvest every 40 years |

If your $\mathrm{i}=6 \%$, whats the maximum you'll pay per hectare if you implement the previous prescription, in a 40 year time line?
8. If Rick bought a house for $90000 €$ in January 2008 and sold it for $192900 €$ in January 2016, what was his rate of return on the investment?
9. If an investment doubles over a 9 year period, what will be the rate of return?

10 . Assume that it costs $250 €$ /ha to successfully regenerate a blackberry stand, that the annual costs include $2 €$ /ha in property taxes plus $1 €$ /ha for management, and the stand produce $11 \mathrm{~m}^{3} / \mathrm{ha}$, valued at $1000 € / \mathrm{m} 3$ and 13 of pulpwood, valued at $10 € /$ on an $80 y e a r$ rotation.
a. What is the present value at the beginning of the rotation, at $4 \%$ discount rate, of costs and revenues from one 80 year rotation in this stand?
b. What is the present value at the beginning of the rotation, at $5 \%$ discount rate, of costs and revenues from one 80 year rotation in this stand?
11. If you invest $1000 €$ in a bond that earns $12 \%$ every 2 years, how much would it be worth in 18 years?
12. If you invest the same $1000 €$ in stocks that earn $8 \%$ annually, how much will your investment be worth in 5 years?
13. Remember that forest with 4 stands in problem set 1 , where you had to build the prescriptions for each stand? Now it's time to evaluate those prescriptions and find the best for each stand if the landowner objective is the maximization of NPV.

| Management <br> Unit | Area (ha) | Specie |
| :--- | :--- | :--- |
| 1 | 5.3 | Maritime <br> pine |
| 2 | 2.1 | Bare land |
| 3 | 0.5 | Eucalyptus |
| 4 | 1.3 | Eucalyptus |
| Total | 9.2 | - |

Assume that wood prices remain constant over time and are:
maritime pine wood $15.5 € / \mathrm{m}^{3}$
eucalyptus pulp wood is $12 € / \mathrm{m}^{3}$
and the discount rate is $3.5 \%$.

The following tables gives you the thinned and harvested volumes for each specie at different ages:

Maritime pine

|  | Planting $\mathbf{1 2 5 0}$ |  | Planting $\mathbf{1 4 0 0}$ |  |
| :--- | :--- | :--- | :--- | :--- |
| Age | Thinned volume <br> $(\mathrm{m} 3 / \mathrm{ha})$ | Harvested volume (m3/ha) | Thinned volume <br> $(\mathrm{m} 3 / \mathrm{ha})$ | Harvested volume <br> $(\mathrm{m} 3 / \mathrm{ha})$ |
| $\mathbf{2 0}$ | 50 | - | 55 | - |
| $\mathbf{2 5}$ | 45 | - | 49 | - |
| $\mathbf{3 0}$ | 35 | - | 42 | - |
| $\mathbf{3 5}$ | 30 | - | 35 | - |
| $\mathbf{4 0}$ | 28 | 103 | 30 | 110 |
| $\mathbf{4 5}$ | 25 | 140 | 28 | 155 |
| $\mathbf{5 0}$ | 24 | 154 | 26 | 180 |
| $\mathbf{5 5}$ |  | 200 |  | 210 |
| $\mathbf{6 0}$ |  | 220 |  | 240 |

Eucalyptus

| Age | Harvested volume (m3/ha) |
| :--- | :--- |
| $\mathbf{1 0}$ | 120 |
| $\mathbf{1 1}$ | 145 |
| $\mathbf{1 2}$ | 155 |

The following table refers to silvicultural operations costs:

| Silvicultural operation | Cost $(\boldsymbol{\epsilon} / \mathrm{ha})$ |
| :--- | :--- |
| Maritime pine plantation <br> (1250 plants) | 250 |
| Maritime pine plantation <br> (1400 plants) | 275 |
| Eucalyptus plantation <br> (1400 plants) | 275 |
| Stool thinning | 100 |

The industry that will buy the maritime pine and eucalyptus wood negotiated with you the value of trees while they are standing, so the costs with thinning's and final harvest are supported by the buyer (so you don't need to take care of it for NPV calculations).

Please, calculate the net present value of each prescription, and find the best for each stand.
(solve this exercise using a spreadsheet, it will make your live easier)
